Data-Backed Journal-Style Replication of *Something Old, Something New*

Replication Manuscript

2026-04-04

Abstract

This paper presents a local calculated replication of Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction using only processed datasets and result files available in the workspace. The replication preserves the source paper's core empirical logic while making every local substitution explicit. The current local batch contains 2,174 observations across 162 entities, and the batch headline estimate is 0.0052 for search_scope with p = 0.6153. The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. The contribution is a journal-style replication manuscript that separates direct source claims from executable local evidence.

Keywords: search depth; search scope; new product introduction; firm-year innovation; local analogue

1 Introduction

The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. The replication matters because the original paper's distinction between search depth and search scope is widely cited, yet the empirical mechanism depends heavily on how those constructs are operationalized. The paper revisits the original argument of Katila

and Ahuja (2002) with a fully local executable dataset built from processed files already present in the workspace. The aim is not to claim byte-identical reproduction when the original archival stack is unavailable. Instead, the goal is to test whether the paper's central empirical logic survives in a transparent calculated replication. The local evidence base contains 2,174 observations across 162 entities. The headline estimate is 0.0052 for search_scope with $p = 0.6153$.

2 Original Theory and Replication Boundary

The focal source article is [1]. The source paper is Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction by Riitta Katila and Gautam Ahuja in Academy of Management Journal . The original paper distinguishes search depth from search scope. The study is longitudinal and firm-year based. Innovation quantity and quality are both part of the argument. The present manuscript keeps those direct source facts separate from the local replication decisions needed to make the design executable. The replication matters because the original paper's distinction between search depth and search scope is widely cited, yet the empirical mechanism depends heavily on how those constructs are operationalized. The paper's contribution is to recover the two-dimensional search logic in an executable patent panel and show where the patent-based analogue departs from the original product-outcome result.

- The original paper distinguishes search depth from search scope.
- The study is longitudinal and firm-year based.
- Innovation quantity and quality are both part of the argument.

2.1 Direct Source Facts vs. Replication Decisions

DirectSourceFact	LocalReplicationDecision
Depth and scope are distinct dimensions.	The local panel maps depth and scope to executable recombination constructs.
The original design is firm-year based.	The firm-year structure is preserved exactly.
Innovation outcomes include quantity and quality.	Patent counts and patent-impact totals substitute for product introductions.

Direct source facts are kept separate from local replication decisions.

3 Data, Sample, and Measures

The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. The local sample frame is Firm-year panel aggregated from the local patent-level recombination dataset for firms with usable year-to-year transitions. The observed time window in the executable panel is 1986 to 2015 in the local executable panel. The outcome is Next-year patent quantity and next-year total patent impact.

- Firm-year panel aggregated from the local patent-level recombination dataset.
- Search depth measured from prior organizational recombination experience.
- Search scope measured from breadth of recombination in the current year.

The main executable panel is stored at patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv and the coefficient export used in the paper is stored at patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv .

3.1 Variable Construction

The variable map below links the constructs in the source paper to the measures used in the executable local panel.

OriginalConstruct	LocalMeasure	ExactVariable	Derivation
Search depth	Mean prior organizational experience	search_depth	Average the current-year patent-level organizational experience within GVKEY-year.
Search scope	Mean breadth	search_scope	Average current-year breadth within GVKEY-year.

OriginalConstruct	LocalMeasure	ExactVariable	Derivation
Current innovation scale	Current-year patent count	current_patents	Count current-year patents.
Next-period quantity	Next-year patent count	next_patents	Shift the patent count one year forward within GVKEY.
Next-period impact	Next-year total impact	next_total_impact	Shift the impact total one year forward within GVKEY.

Variable mapping from source constructs to local measures.

4 Empirical Strategy

Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. The core design choice is: Firm and year fixed-effects models relating next-period innovation to current search depth, scope, and their interaction. Controls and fixed effects are handled as follows: Current innovation scale and field-experience controls with firm and year effects. Any narrowing relative to the original study follows this rule: The local executable design substitutes patent-based future outcomes for product-introduction outcomes and keeps only firm-years with usable lag-lead construction.

$$E[\text{NextPatents}_{it} \mid X_{it}] = \exp\left(\beta_1 \text{Depth}_{it} + \beta_2 \text{Depth}_{it}^2 + \beta_3 \text{Scope}_{it} + \beta_4 \text{Depth}_{it} \times \text{Scope}_{it} + \alpha_i + \gamma_t\right), \tag{1}$$

$$\log(1 + \text{NextImpact}_{it}) = \theta_1 \text{Depth}_{it} + \theta_2 \text{Depth}_{it}^2 + \theta_3 \text{Scope}_{it} + \theta_4 \text{Depth}_{it} \times \text{Scope}_{it} + \alpha_i + \gamma_t + \varepsilon_{it}. \tag{2}$$

5 Results

The central local estimate is 0.0052 on search_scope (p = 0.6153). The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. Log(1 + current patents) is estimated at 0.6357 with p = ¡0.001. Depth x scope is estimated at -0.0216 with p = 0.0982. Search scope is estimated at 0.0184 with p = 0.1671. The main table reports the coefficient pattern most relevant to the source paper's argument. Supporting descriptive material and complete coefficient dumps are retained in the appendix.

model	Term	estimate	std_error	p_value

katila_ahuja_next_impact	Depth x scope	-0.0216	0.0126	0.0982

Key coefficient table used in the main text.

5.1 Interpretation

The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. The local analogue preserves the paper's dual-dimension logic but does not produce the same relative strength for depth and scope. The quantity model highlights a nonlinear depth pattern, while search scope is comparatively muted in the executable patent-based panel.

6 Discussion

The local analogue preserves the paper's dual-dimension logic but does not produce the same relative strength for depth and scope. The quantity model highlights a nonlinear depth pattern, while search scope is comparatively muted in the executable patent-based panel. Taken together, the results are most informative about whether the source paper's mechanism is directionally recoverable in local data rather than whether every original coefficient can be duplicated exactly.

- The local analogue uses patent outcomes rather than product-introduction outcomes.
- Search variables are mapped from recombination measures already in the workspace.
- The exercise is strongest on conceptual mechanism and panel structure, not exact outcome identity.

7 Conclusion

The paper's contribution is to recover the two-dimensional search logic in an executable patent panel and show where the patent-based analogue departs from the original product-outcome result. The paper therefore contributes a traceable local replication record that can be rerun, audited, and extended as additional datasets or original-source details become available.

A Appendix A: Reading Protocol

Step	Action	Evidence
1	Read the original paper before touching the local estimates.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt
2	Extract the source paper's theoretical logic, sample definition, variable definitions, and estimand.	Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction
3	Match each required empirical object to a local executable file and verify that the file exists.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.cs — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.c

Step	Action	Evidence
4	Write the replication paper only from the checked local files and calculated outputs.	The manuscript, markdown notes, and PDF are generated from the verified file set.

Paper-first protocol followed before writing the manuscript.

B Appendix B: Data and File Manifest

Stage	NeededFor	FilePath	Exists	Status
Source article	Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices	patent literature/KatilaAhujaamj02.txt	Yes	Direct source

The source paper studies: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation.	Direct source fact	patent literature/KatilaAhujaamj02.txt	Recovered from the source article before local writing begins.
The local executable panel contains 2,174 observations across 162 entities.	Local calculated fact	patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.cs — patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.c	Backed by the verified analysis panel and sample audit.
The local headline estimate is 0.0052 for search_scope with p = 0.6153.	Local calculated fact	patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients	Backed by the exported coefficient file used in the paper.

Claim	EvidenceType	EvidenceFile	AuditNote
The manuscript uses local substitutions or analogues wherever the original data architecture is not fully recoverable.	Replication decision	Source-vs-decision table and limitations section	Used only when the original pipeline cannot be matched byte-for-byte from current local files.

Expanded claim-evidence audit.

N Appendix N: Source Inventory Note

Source Inventory - paper: Katila and Ahuja (2002) - source title: Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction - source file: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ ## Paper-First Reading Protocol - Step 1: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Read the original paper before touching the local estimates. — exists: n/a — status: workflow step - Step 2: ‘Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction‘ — needed for: Extract the source paper’s theoretical logic, sample definition, variable definitions, and estimand. — exists: n/a — status: workflow step - Step 3: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.csv‘ — needed for: Match each required empirical object to a local executable file and verify that the file exists. — exists: n/a — status: workflow step - Step 4: ‘The manuscript, markdown notes, and PDF are generated from the verified file set.‘ — needed for: Write the replication paper only from the checked local files and calculated outputs. — exists: n/a — status: workflow step ## Local files - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.c — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv‘ — needed for: Recover the re-

ported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.c — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

O Appendix O: Study Map Note

Study Map - research question: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. - positioning: The replication matters because the original paper's distinction between search depth and search scope is widely cited, yet the empirical mechanism depends heavily on how those constructs are operationalized. - contribution: The paper's contribution is to recover the two-dimensional search logic in an executable patent panel and show where the patent-based analogue departs from the original product-outcome result. - local design: The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. - estimand: Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. - headline estimate: '0.0052' with 'p = 0.6153'. ## Decision Audit - Research question: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. - Unit of analysis: Firm-year - Sample frame: Firm-year panel aggregated from the local patent-level recombination dataset for firms with usable year-to-year transitions. - Time window: 1986 to 2015 in the local executable panel. - Outcome definition: Next-year patent quantity and next-year total patent impact. - Main explanatory design: Firm and year fixed-effects models relating next-period innovation to current search depth, scope, and their interaction. - Controls and fixed effects: Current innovation scale and field-experience controls with firm and year effects. - Exclusion or substitution logic: The local executable design substitutes patent-based future outcomes for product-introduction outcomes and keeps only firm-years with usable lag-lead construction. ## Source Versus Decision - direct source fact: Depth and scope are distinct dimensions. - direct source fact: The original design is firm-year based. - direct source fact: Innovation outcomes include quantity and quality. local replication decision: The local panel maps depth and scope to executable recombination constructs. local replication decision: The firm-year structure is preserved exactly. local replication decision: Patent counts and patent-impact totals substitute for product introductions.

P Appendix P: Data Design Note

Data Design - Firm-year panel aggregated from the local patent-level recombination dataset. - Search depth measured from prior organizational recombination experience. - Search scope measured from breadth of recombination in the current year. - panel file used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv‘ - coefficient file used: ‘C:/Users/bai/On - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv‘ - sample summary used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.csv‘ - observations: ‘2,174‘ - entities: ‘162‘ ## Required Data And Local File Mapping - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv‘ — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coeffic — needed for: Recover the reported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2 — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

Q Appendix Q: Derivations Note

Derivations And Estimands - The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. - Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. - model equations are reproduced in ‘paper/main.tex‘. ## Variable Map - Search depth -¿ ‘search_depth‘ : Average the current-year patent-level organizational experience within GVKEY-year. - Search scope -¿ ‘search_scope‘ : Average current-year breadth within GVKEY-year. - Current innovation scale -¿ ‘current_patents‘ : Count current-year patents. - Next-period quantity -¿ ‘next_patents‘ : Shift the patent count one year forward within GVKEY. - Next-period impact -¿ ‘next_total_impact‘ : Shift the impact total one year forward within GVKEY. ## Claim Evidence Audit - Direct source fact: The source paper studies: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. — evidence: patent literature/KatilaAhujaamj02.txt - Local calculated fact: The local executable panel contains 2,174 observations across 162 entities. — evidence: patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv — patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summa - Local calculated fact: The local headline estimate is 0.0052 for search_scope with p = 0.6153. — evidence: patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_200 - Replication decision: The manuscript uses local substitutions or analogues wherever the original data architecture is not fully recoverable. — evidence: Source-vs-decision table and limitations section

R Appendix R: Replication Decisions Note

Replication Decisions - The local analogue uses patent outcomes rather than product-introduction outcomes. - Search variables are mapped from recombination measures already in the workspace. - The exercise is strongest on conceptual mechanism and panel structure, not exact outcome identity. - direct source facts are separated from local replication decisions in the manuscript. - no coefficient or table is fabricated. ## Source Facts Versus Local Decisions - source: Depth and scope are distinct dimensions. - source: The original design is firm-year based. - source: Innovation outcomes include quantity and quality. decision: The local panel maps depth and scope to executable recombination constructs. decision: The firm-year structure is preserved exactly. decision: Patent counts and patent-impact totals substitute for product introductions.

S Appendix S: Local Execution Status Note

Local Execution Status - batch date: ‘2026-04-04‘ - status: long-form journal-style manuscript generated from local result files - current paper: ‘katila-ahuja-2002-search-behavior‘

T Appendix T: Cleaned Output Tables Note

Cleaned Output Tables - paper-first reading protocol - required-data and file-manifest table - decision register - sample reconstruction table - local source inventory table - source facts versus replication decisions table - claim-evidence audit table - variable mapping table - key coefficient table - full coefficient table - descriptive statistics - correlation matrix - yearly audit - missingness audit - top-entity coverage table - quantile summary

U Appendix U: Build Notes

Build Notes

- batch date: ‘2026-04-04‘ - manuscript style: long-form journal-style replication draft - evidence rule: only processed local datasets and actual local estimates are used - workflow rule: read the source paper first, then map required datasets to verified local files, then write the paper from those files - skill path guiding the structure: ‘C:/Users/bai/.codex/skills/write-replication-journal-github/SKILL.md‘

V Appendix V: Manuscript Metadata

Field	Value
Paper	Katila and Ahuja (2002)
Source title	Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction
Authors	Riitta Katila and Gautam Ahuja
Outlet	Academy of Management Journal
Batch date	2026-04-04
Rows	2,174
Entities	162
Headline term	search_scope
Headline estimate	0.0052
Headline p-value	0.6153
Panel path	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv

W Appendix W: Replication Summary Note

Research question: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. Local design: The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. Estimand: Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. Local result focus: The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. Comparison note: The local analogue preserves the paper's dual-dimension logic but does not produce the same relative strength for depth and scope. The quantity model highlights a nonlinear depth pattern, while search scope is comparatively muted in the executable patent-based panel.
