Data-Backed Journal-Style Replication of *Something Old, Something New*

Codex journal-replication workflow

2026-04-04

Abstract

This manuscript expands the local replication folder for Katila and Ahuja (2002) into a long journal-style paper using only processed datasets already present in the workspace. The current local batch contains 2,174 observations across 162 entities, and the batch headline estimate is 0.0052 for search_scope with p = 0.6153. The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. The draft imitates the structure of the source article while documenting the exact places where local replication decisions depart from direct source facts.

Keywords: search depth; search scope; new product introduction; firm-year innovation; local analogue

1 Paper-First Reading Protocol

The workflow for this manuscript is intentionally ordered. The source paper is read first, the required empirical objects are identified second, the local files are verified third, and only then is the replication paper written from the checked evidence chain.

Step	Action	Evidence
1	Read the original paper before touching the local estimates.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt
2	Extract the source paper's theoretical logic, sample definition, variable definitions, and estimand.	Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction
3	Match each required empirical object to a local executable file and verify that the file exists.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.cs — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.c

Step	Action	Evidence
4	Write the replication paper only from the checked local files and calculated outputs.	The manuscript, markdown notes, and PDF are generated from the verified file set.

Ordered protocol used for this replication paper.

2 Required Data and Local File Manifest

This section answers the basic replication question of where the data are. Each empirical object is mapped to a concrete local file before the estimates are interpreted. Workspace root: C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions

Stage	NeededFor	FilePath	Exists	Status
Source article	Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices	patent literature/KatilaAhujaamj02.txt	Yes	Direct source
Analysis panel	Estimate the local model and regenerate descriptive statistics	patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv	Yes	Executable local dataset

Stage	NeededFor	FilePath	Exists	Status
Coefficient export	Recover the reported local coefficients and p-values	patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv	Yes	Executable local result file
Sample summary	Audit sample construction and raw grouped moments	patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.csv	Yes	Executable local result file

Exact local files used by the manuscript.

3 Introduction

The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. The point of the present draft is not to pretend that every original source file has been recovered. It is to turn the executable local evidence into a paper that preserves theory, data architecture, variable mapping, and empirical claims in one place. The current local batch contains 2,174 observations across 162 entities, and the batch headline estimate is 0.0052 for search_scope with $p = 0.6153$. The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes.

4 Original Paper, Theory, and Published Estimand

The focal source article is [1]. The source paper is Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction by Riitta Katila and Gautam Ahuja in Academy of Management Journal . The original paper distinguishes search depth from search scope. The study is longitudinal and firm-year based. Innovation quantity and quality are both part of the argument. A useful replication discipline is to keep source facts and replication decisions separate. Source facts describe what the paper says. Replication decisions describe what the local executable workflow must do because it is limited to processed datasets already present in the workspace.

- The original paper distinguishes search depth from search scope.
- The study is longitudinal and firm-year based.
- Innovation quantity and quality are both part of the argument.

DirectSourceFact	LocalReplicationDecision
Depth and scope are distinct dimensions.	The local panel maps depth and scope to executable recombination constructs.
The original design is firm-year based.	The firm-year structure is preserved exactly.
Innovation outcomes include quantity and quality.	Patent counts and patent-impact totals substitute for product introductions.

Direct source facts are kept separate from local replication decisions.

5 Local Data Inventory and Sample Reconstruction

The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. Every number in this manuscript is backed by local files in patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior or by the explicitly referenced processed regression panel.

- Firm-year panel aggregated from the local patent-level recombination dataset.
- Search depth measured from prior organizational recombination experience.
- Search scope measured from breadth of recombination in the current year.

File	Role
katila_ahuja_2002_analysis_dataset.csv	Firm-year search-behavior panel
katila_ahuja_2002_model_coefficients.csv	Quantity and impact coefficient table
katila_ahuja_2002_sample_summary.csv	Sample statistics

Local executable files used by this paper.

Statistic	Value
rows	2174.0000
unique_firms	162.0000
year_min	1986.0000
year_max	2015.0000
mean_search_depth	0.6637
mean_search_scope	4.2347
mean_next_patents	10.6026

Sample reconstruction table from the local results folder.

6 Variable Mapping, Derivations, and Replication Decisions

The variable map is the bridge between the source article and the executable local workflow.

OriginalConstruct	LocalMeasure	ExactVariable	Derivation
Search depth	Mean prior organizational experience	search_depth	Average the current-year patent-level organizational experience within GVKEY-year.
Search scope	Mean breadth	search_scope	Average current-year breadth within GVKEY-year.
Current innovation scale	Current-year patent count	current_patents	Count current-year patents.
Next-period quantity	Next-year patent count	next_patents	Shift the patent count one year forward within GVKEY.
Next-period impact	Next-year total impact	next_total_impact	Shift the impact total one year forward within GVKEY.

Variable mapping from source constructs to local measures. Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction.

$$E[\text{NextPatents}_{it} \mid X_{it}] = \exp\left(\beta_1 \text{Depth}_{it} + \beta_2 \text{Depth}_{it}^2 + \beta_3 \text{Scope}_{it} + \beta_4 \text{Depth}_{it} \times \text{Scope}_{it} + \alpha_i + \gamma_t\right), \tag{1}$$

$$\log(1 + \text{NextImpact}_{it}) = \theta_1 \text{Depth}_{it} + \theta_2 \text{Depth}_{it}^2 + \theta_3 \text{Scope}_{it} + \theta_4 \text{Depth}_{it} \times \text{Scope}_{it} + \alpha_i + \gamma_t + \varepsilon_{it}. \tag{2}$$

7 Empirical Design and Identification Limits

The local design remains strongest when it preserves the original unit of analysis and interaction logic, even if some measurement layers are reconstructed with defensible analogues rather than identical source files.

- The local analogue uses patent outcomes rather than product-introduction outcomes.
- Search variables are mapped from recombination measures already in the workspace.
- The exercise is strongest on conceptual mechanism and panel structure, not exact outcome identity.

8 Main Results

Search depth is estimated at -0.2243 with p = 0.0250 in model katila_ahuja_next_patents. Search depth squared is estimated at 0.1059 with p = ¡0.001 in model katila_ahuja_next_patents. Search scope is estimated at 0.0052 with p = 0.6153 in model katila_ahuja_next_patents. Log(1 + current patents) is estimated at 0.6654 with p = ¡0.001 in model katila_ahuja_next_patents. Mean field experience is estimated at -0.0429 with p = 0.1018 in model katila_ahuja_next_patents. Depth x scope is estimated at -0.0115 with p = 0.2651 in model katila_ahuja_next_patents. Search depth is estimated at -0.1070 with p = 0.3854 in model katila_ahuja_next_impact. Search depth squared is estimated at 0.0388 with p = 0.2375 in model katila_ahuja_next_impact. Search scope is estimated

at 0.0184 with p = 0.1671 in model katila_ahuja_next_impact. Log(1 + current patents) is estimated at 0.6357 with p = ¡0.001 in model katila_ahuja_next_impact. Mean field experience is estimated at 0.0271 with p = 0.4444 in model katila_ahuja_next_impact. Depth x scope is estimated at -0.0216 with p = 0.0982 in model katila_ahuja_next_impact.

model	Term	estimate	std_error	p_value
katila_ahuja_next_patents	Search depth	-0.2243	0.1001	0.0250
katila_ahuja_next_patents	Search depth squared	0.1059	0.0299	0.0004

Quantile summary linking the main regressor to the local outcome.

9 Comparison to the Published Paper and Remaining Gaps

The local analogue preserves the paper's dual-dimension logic but does not produce the same relative strength for depth and scope. The quantity model highlights a nonlinear depth pattern, while search scope is comparatively muted in the executable patent-based panel. The honest replication standard is to describe the gap without smoothing it over. A useful local paper tells the next researcher exactly which parts of the original design are recoverable now and which parts remain approximated.

10 Discussion and Conclusion

The manuscript turns a replication folder into a paper that can be uploaded, cited internally, and rerun later without guessing how the evidence was assembled. For Katila and Ahuja (2002) the bottom line is: The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes.

search_depth:search_scope	-0.0216	0.0126	-1.7086	0.0982	katila_ahuja_next_impa

Full coefficient dump exported from the local estimation script.

J Appendix J: Missingness Audit

Variable	Missing	MissingShare
Search depth	0.0000	0.0000
Search scope	0.0000	0.0000
Current patents	0.0000	0.0000
Current total impact	0.0000	0.0000
Mean field experience	0.0000	0.0000
Next-year patents	0.0000	0.0000
Next-year total impact	0.0000	0.0000

Missingness audit for the variables summarized in the manuscript.

K Appendix K: Coverage of the Most Observed Entities

Entity	Observations	FirstPeriod	LastPeriod
10499.0000	30.0000	1986.0000	2015.0000
10983.0000	30.0000	1986.0000	2015.0000
1300.0000	30.0000	1986.0000	2015.0000
2285.0000	30.0000	1986.0000	2015.0000
2403.0000	30.0000	1986.0000	2015.0000
3532.0000	30.0000	1986.0000	2015.0000
4087.0000	30.0000	1986.0000	2015.0000
4321.0000	30.0000	1986.0000	2015.0000
4503.0000	30.0000	1986.0000	2015.0000
4839.0000	30.0000	1986.0000	2015.0000
5047.0000	30.0000	1986.0000	2015.0000
5439.0000	30.0000	1986.0000	2015.0000
6066.0000	30.0000	1986.0000	2015.0000
6266.0000	30.0000	1986.0000	2015.0000
7435.0000	30.0000	1986.0000	2015.0000
8762.0000	30.0000	1986.0000	2015.0000
2817.0000	29.0000	1986.0000	2015.0000
3835.0000	29.0000	1986.0000	2015.0000
6435.0000	29.0000	1986.0000	2015.0000
7257.0000	29.0000	1986.0000	2015.0000

Top entities by local observation count.

L Appendix L: Source Inventory Note

Source Inventory - paper: Katila and Ahuja (2002) - source title: Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction - source file: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ ## Paper-First Reading Protocol - Step 1: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Read the original paper before touching the local estimates. — exists: n/a — status: workflow step - Step 2: ‘Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction‘ — needed for: Extract the source paper’s theoretical logic, sample definition, variable definitions, and estimand. — exists: n/a — status: workflow step - Step 3: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.csv‘ — needed for: Match each required empirical object to a local executable file and verify that the file exists. — exists: n/a — status: workflow step - Step 4: ‘The manuscript, markdown notes, and PDF are generated from the verified file set.‘ — needed for: Write the replication paper only from the checked local files and calculated outputs. — exists: n/a — status: workflow step ## Local files - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.c — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv‘ — needed for: Recover the re-

ported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.c — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

M Appendix M: Study Map Note

Study Map - research question: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. - local design: The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. - estimand: Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. - headline estimate: '0.0052' with 'p = 0.6153'. ## Decision Audit - direct source fact: Depth and scope are distinct dimensions. - direct source fact: The original design is firm-year based. - direct source fact: Innovation outcomes include quantity and quality. local replication decision: The local panel maps depth and scope to executable recombination constructs. local replication decision: The firm-year structure is preserved exactly. local replication decision: Patent counts and patent-impact totals substitute for product introductions.

N Appendix N: Data Design Note

Data Design - Firm-year panel aggregated from the local patent-level recombination dataset. - Search depth measured from prior organizational recombination experience. - Search scope measured from breadth of recombination in the current year. - panel file used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv‘ - coefficient file used: ‘C:/Users/bai/On - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coefficients.csv‘ - sample summary used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_sample_summary.csv‘ - observations: ‘2,174‘ - entities: ‘162‘ ## Required Data And Local File Mapping - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/KatilaAhujaamj02.txt‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_analysis_dataset.csv‘ — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2002_model_coeffic — needed for: Recover the reported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/katila-ahuja-2002-search-behavior/results/katila_ahuja_2 — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

O Appendix O: Derivations Note

Derivations And Estimands - The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. - Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. - model equations are reproduced in ‘paper/main.tex‘. ## Variable Map - Search depth -¿ ‘search_depth‘ : Average the current-year patent-level organizational experience within GVKEY-year. - Search scope -¿ ‘search_scope‘ : Average current-year breadth within GVKEY-year. - Current innovation scale -¿ ‘current_patents‘ : Count current-year patents. - Next-period quantity -¿ ‘next_patents‘ : Shift the patent count one year forward within GVKEY. - Next-period impact -¿ ‘next_total_impact‘ : Shift the impact total one year forward within GVKEY.

P Appendix P: Replication Decisions Note

Replication Decisions - The local analogue uses patent outcomes rather than product-introduction outcomes. - Search variables are mapped from recombination measures already in the workspace. - The exercise is strongest on conceptual mechanism and panel structure, not exact outcome identity. - direct source facts are separated from local replication decisions in the manuscript. - no coefficient or table is fabricated. ## Source Facts Versus Local Decisions - source: Depth and scope are distinct dimensions. - source: The original design is firm-year based. - source: Innovation outcomes include quantity and quality. decision: The local panel maps depth and scope to executable recombination constructs. decision: The firm-year structure is preserved exactly. decision: Patent counts and patent-impact totals substitute for product introductions.

Q Appendix Q: Local Execution Status Note

Local Execution Status - batch date: ‘2026-04-04‘ - status: long-form journal-style manuscript generated from local result files - current paper: ‘katila-ahuja-2002-search-behavior‘

R Appendix R: Cleaned Output Tables Note

Cleaned Output Tables - paper-first reading protocol - required-data and file-manifest table - sample reconstruction table - local source inventory table - source facts versus replication decisions table - variable mapping table - key coefficient table - full coefficient table - descriptive statistics - correlation matrix - yearly audit - missingness audit - top-entity coverage table - quantile summary

S Appendix S: Build Notes

Build Notes

- batch date: ‘2026-04-04‘ - manuscript style: long-form journal-style replication draft - evidence rule: only processed local datasets and actual local estimates are used - workflow rule: read the source paper first, then map required datasets to verified local files, then write the paper from those files - skill path guiding the structure: ‘C:/Users/bai/.codex/skills/write-replication-journal-github/SKILL.md‘

T Appendix T: Manuscript Metadata

Field	Value
Paper	Katila and Ahuja (2002)
Source title	Something Old, Something New: A Longitudinal Study of Search Behavior and New Product Introduction
Authors	Riitta Katila and Gautam Ahuja

U Appendix U: Replication Summary Note

Research question: The source paper asks whether search depth and search scope are distinct dimensions and how they shape subsequent innovation. Local design: The local analogue aggregates the patent-level recombination panel to firm-years and uses patent-based outcomes in place of the source paper's product-introduction outcomes. Estimand: Firm and year fixed-effects models for next-year patent counts and next-year total impact using local depth, scope, and their interaction. Local result focus: The local quantity model points to a nonlinear depth effect and a weaker role for search scope than the source paper emphasizes. Comparison note: The local analogue preserves the paper's dual-dimension logic but does not produce the same relative strength for depth and scope. The quantity model highlights a nonlinear depth pattern, while search scope is comparatively muted in the executable patent-based panel.
