Data-Backed Journal-Style Replication of *Ambition Is Nothing Without Focus*

Codex journal-replication workflow

2026-04-04

Abstract

This manuscript expands the local replication folder for Ghosh, Martin, Pennings, and Wezel (2014) into a long journal-style paper using only processed datasets already present in the workspace. The current local batch contains 489,193 observations across 200 entities, and the batch headline estimate is -0.0022 for breadth x org_recomb_exp_log with p = 0.0076. The local rerun strongly preserves the negative breadth-by-experience interaction and the negative three-way interaction with organizational focus. The draft imitates the structure of the source article while documenting the exact places where local replication decisions depart from direct source facts.

Keywords: recombination breadth; organizational focus; inventive impact; patent citations; local reproduction

1 Paper-First Reading Protocol

The workflow for this manuscript is intentionally ordered. The source paper is read first, the required empirical objects are identified second, the local files are verified third, and only then is the replication paper written from the checked evidence chain.

Step	Action	Evidence
1	Read the original paper before touching the local estimates.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf
2	Extract the source paper's theoretical logic, sample definition, variable definitions, and estimand.	Ambition Is Nothing Without Focus: Compensating for Negative Transfer of Experience in R&D
3	Match each required empirical object to a local executable file and verify that the file exists.	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output/gvkey_ — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv

Step	Action	Evidence
4	Write the replication paper only from the checked local files and calculated outputs.	The manuscript, markdown notes, and PDF are generated from the verified file set.

Ordered protocol used for this replication paper.

2 Required Data and Local File Manifest

This section answers the basic replication question of where the data are. Each empirical object is mapped to a concrete local file before the estimates are interpreted. Workspace root: C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions

Stage	NeededFor	FilePath	Exists	Status
Source article	Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices	Project 1_Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf	Yes	Direct source
Analysis panel	Estimate the local model and regenerate descriptive statistics	Data_Analysis/code/Regression/outputs/cleaned_dataset	Yes	Executable local reproduction

Stage	NeededFor	FilePath	Exists	Status
Coefficient export	Recover the reported local coefficients and p-values	patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv	Yes	Executable local result file
Sample summary	Audit sample construction and raw grouped moments	patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv	Yes	Executable local result file

Exact local files used by the manuscript.

3 Introduction

The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer. The point of the present draft is not to pretend that every original source file has been recovered. It is to turn the executable local evidence into a paper that preserves theory, data architecture, variable mapping, and empirical claims in one place. The current local batch contains 489,193 observations across 200 entities, and the batch headline estimate is -0.0022 for breadth x org_recomb_exp_log with p = 0.0076. The local rerun strongly preserves the negative breadth-by-experience interaction and the negative three-way interaction with organizational focus.

4 Research Positioning and Contribution

The replication matters because it targets a mechanism-heavy paper where the interaction structure, not only the sign of a main effect, is the core theoretical claim. The paper's contribution is a near-structure-preserving reproduction that shows how the source mechanism survives in a fully local cleaned patent panel. The writing stance follows a conservative paper-first workflow: the source paper defines the theoretical target, the local files define the executable boundary, and the replication paper names the distance between the two rather than smoothing it over.

5 Original Paper, Theory, and Published Estimand

The focal source article is [1]. The source paper is Ambition Is Nothing Without Focus: Compensating for Negative Transfer of Experience in R&D by Anindya Ghosh, Xavier Martin, Johannes M. Pennings, and Filippo Carlo Wezel in Organization Science . The source paper studies the interaction of breadth, organizational experience, and focus. Forward citations proxy inventive impact. The unit of analysis is the patent. A useful replication discipline is to keep source facts and replication decisions separate. Source facts describe what the paper says. Replication decisions describe what the local executable workflow must do because it is limited to processed datasets already present in the workspace.

- The source paper studies the interaction of breadth, organizational experience, and focus.
- Forward citations proxy inventive impact.
- The unit of analysis is the patent.

DirectSourceFact	LocalReplicationDecision
The interaction structure is the theoretical core.	The local rerun keeps the same interaction logic on the clean GVKEY-based panel.
Forward citations measure impact.	The local impact measure is the executable citation outcome already stored in the panel.
The paper works at the patent level.	The sample is narrowed to active S&P 500 utility patents with unambiguous assignment.

Direct source facts are kept separate from local replication decisions.

6 Decision Register

The table below makes the major design choices explicit before any coefficient is interpreted.

DecisionPoint	LocalSpecification
Research question	The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer.
Unit of analysis	Patent

DecisionPoint	LocalSpecification
Sample frame	Active S&P 500 utility patents with unambiguous GVKEY assignment in the local cleaned reproduction pipeline.
Time window	1986 to 2016 in the local executable panel.
Outcome definition	Patent-level inventive impact measured from forward citations.
Main explanatory design	Patent-level count model with breadth, organizational experience, organizational focus, and their interactions.
Controls and fixed effects	Prior-art citations, recombination degree, field experience, scale, age, plus firm and application-year fixed effects; clustered inference when available.
Exclusion or substitution logic	The executable sample drops ambiguous firm-patent assignments and limits the panel to locally verified active S&P 500 utility patents.

Decision register for the local replication design.

7 Local Data Inventory and Sample Reconstruction

The local rerun uses the clean GVKEY-anchored utility-patent panel already built in the workspace and keeps the patent-level interaction structure of the original paper. Every number in this manuscript is backed by local files in patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus or by the explicitly referenced processed regression panel.

- Clean GVKEY-anchored S&P 500 utility-patent panel from the local replication pipeline.
- PatentView-derived application year and citation outcomes.
- CRSP-Compustat linked firm-year filters and sector information already present in the workspace.

File	Role
gvkey_clean_reproduction_dataset.csv	Clean patent-level regression panel
ghosh_2014_model_coefficients.csv	Baseline coefficient dump
ghosh_2014_focus_table.csv	Headline interaction estimates across sample variants
ghosh_2014_sample_summary.csv	Sample-construction audit log

Local executable files used by this paper.

Step	Rows	UniquePatents	UniqueGVKEY	UniqueYears	AmbiguousPatents	Notes
regression_dataset_raw	499486.0000	495460.0000	204.0000	31.0000	NA	Patent-level regression dataset produced by Regression.R
after_active_and_patentype_dedupe	499486.0000	495460.0000	204.0000	31.0000	3678.0000	Active panel duplicates on gvkey-year before tie-break: 0
sp500_utility_drop_ambiguous	489193.0000	489193.0000	200.0000	31.0000	0.0000	Final clean sample used for reproduction

Sample reconstruction table from the local results folder.

8 Variable Mapping, Derivations, and Replication Decisions

The variable map is the bridge between the source article and the executable local workflow.

OriginalConstruct	LocalMeasure	ExactVariable	Derivation
Inventive impact	Forward citations	inventive_impact	Use the local cleaned citation outcome already stored in the regression dataset.
Breadth	Centered breadth	breadth_c	Carry forward the centered breadth variable from the local regression output.
Organizational experience	Centered log prior organizational experience	org_recomb_exp_log_c	Carry forward the centered log experience variable from the same panel.
Organizational focus	Centered firm-year focus	org_focus_c	Use the contemporaneous focus measure already reconstructed in the local pipeline.
Controls	Prior-art citations, degree, field experience, scale, age	n_prior_art_cites; recomb_degree; field_recomb_exp_log; total_patents_same_year; firm_age	Reuse the local patent-level controls and fixed effects.

Variable mapping from source constructs to local measures. A patent-level count model with interactions among breadth, organizational recombination experience, and organizational focus, plus firm and year controls.

$$E[\text{Impact}_{pft} \mid Z_{pft}] = \exp\big(\beta_1 \text{Breadth}_{pft} + \beta_2 \text{OrgExp}_{pft} + \beta_3 \text{Focus}_{ft} + \beta_4 \text{Breadth}_{pft} \times \text{OrgExp}_{pft} + \beta_5 \text{OrgExp}_{pft} \tag{1}$$

9 Empirical Design and Identification Limits

The local design remains strongest when it preserves the original unit of analysis and interaction logic, even if some measurement layers are reconstructed with defensible analogues rather than identical source files.

- The local clean sample is paper-comparable rather than guaranteed identical to the archival source frame.
- Patent-firm matching and sample filters follow the executable local pipeline.
- Interpretation should emphasize mechanism recovery more than exact coefficient duplication.

10 Main Results

Breadth is estimated at 0.0030 with p = 0.8477 in model poisson_baseline. Organizational experience is estimated at 0.0706 with p = 0.0461 in model poisson_baseline. Organizational focus is estimated at -0.3609 with p = 0.3373 in model poisson_baseline. Breadth x org. experience is estimated at -0.0022 with p = 0.0076 in model poisson_baseline. Org. experience x focus is estimated at 0.3219 with p = 0.0703 in model poisson_baseline. Breadth x org. experience x focus is estimated at -0.1705 with p = 0.0152 in model poisson_baseline. Breadth is estimated at 0.0147 with p = 0.3159 in model logit_top5. Organizational experience is estimated at 0.0988 with p = 0.0256 in model logit_top5. Organizational focus is estimated at -0.8737 with p = 0.5200 in model logit_top5. Breadth x org. experience is estimated at -0.0118 with p = ¡0.001 in model logit_top5.

Org. experience x focus is estimated at 0.0361 with p = 0.9680 in model logit_top5. Breadth x org. experience x focus is estimated at -0.2765 with p = 0.3557 in model logit_top5. Breadth is estimated at -0.0099 with p = 0.6686 in model logit_top1. Organizational experience is estimated at 0.1380 with p = 0.1395 in model logit_top1. Organizational focus is estimated at -0.9087 with p = 0.8056 in model logit_top1. Breadth x org. experience is estimated at -0.0132 with p = 0.0184 in model logit_top1. Org. experience x focus is estimated at -0.5147 with p = 0.8763 in model logit_top1. Breadth x org. experience x focus is estimated at -0.6392 with p = 0.5361 in model logit_top1.

11 Claim-Evidence Audit

This audit prevents the paper from blurring together original-paper statements, local estimates, and replication judgments.

Claim	EvidenceType	EvidenceFile	AuditNote
The source paper studies: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer.	Direct source fact	Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf	Recovered from the source article before local writing begins.
The local executable panel contains 489,193 observations across 200 entities.	Local calculated fact	Data_Analysis/code/Regression/output/gvkey_clean_ — patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv	Basic output verified analysis and sample audit.

Claim	EvidenceType	EvidenceFile	AuditNote
The local headline estimate is -0.0022 for breadth x org_recomb_exp_log with p = 0.0076.	Local calculated fact	patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv	Backed by the exported coefficient file used in the paper.
The manuscript uses local substitutions or analogues wherever the original data architecture is not fully recoverable.	Replication decision	Source-vs-decision table and limitations section	Used only when the original pipeline cannot be matched byte-for-byte from current local files.

Claim-evidence audit for the current manuscript.

12 Comparison to the Published Paper and Remaining Gaps

This is the strongest executable match in the current batch. The negative breadth-by-experience interaction survives clearly, and the three-way interaction with focus remains negative and statistically meaningful, which means the central mechanism of the source paper is recovered in the local panel. The honest replication standard is to describe the gap without smoothing it over. A useful local paper tells the next researcher exactly which parts of the original design are recoverable now and which parts remain approximated.

13 Discussion and Conclusion

The manuscript turns a replication folder into a paper that can be uploaded, cited internally, and rerun later without guessing how the evidence was assembled. For Ghosh, Martin, Pennings, and Wezel (2014) the bottom line is: The local rerun strongly preserves the negative breadth-by-experience interaction and the negative three-way interaction with organizational focus.

A Appendix A: Source Inventory

Stage	NeededFor	FilePath	Exists	Status

Top entities by local observation count.

M Appendix M: Claim-Evidence Audit

Claim	EvidenceType	EvidenceFile	AuditNote
The source paper studies: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer.	Direct source fact	Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf	Recovered from the source article before local writing begins.
The local executable panel contains 489,193 observations across 200 entities.	Local calculated fact	Data_Analysis/code/Regression/output/gvkey_clean_ — patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv	Based on the verified analysis and sample audit.
The local headline estimate is -0.0022 for breadth x org_recomb_exp_log with p = 0.0076.	Local calculated fact	patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv	Backed by the exported coefficient file used in the paper.

Claim	EvidenceType	EvidenceFile	AuditNote
The manuscript uses local substitutions or analogues wherever the original data architecture is not fully recoverable.	Replication decision	Source-vs-decision table and limitations section	Used only when the original pipeline cannot be matched byte-for-byte from current local files.

Expanded claim-evidence audit.

N Appendix N: Source Inventory Note

Source Inventory - paper: Ghosh, Martin, Pennings, and Wezel (2014) - source title: Ambition Is Nothing Without Focus: Compensating for Negative Transfer of Experience in R&D - source file: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf‘ ## Paper-First Reading Protocol - Step 1: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf‘ — needed for: Read the original paper before touching the local estimates. — exists: n/a — status: workflow step - Step 2: ‘Ambition Is Nothing Without Focus: Compensating for Negative Transfer of Experience in R&D‘ — needed for: Extract the source paper’s theoretical logic, sample definition, variable definitions, and estimand. — exists: n/a — status: workflow step - Step 3: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output/gvkey_clean_reproduction — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv — C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv‘ — needed for: Match each required empirical object to a local executable file and verify that the file exists. — exists: n/a — status: workflow step - Step 4: ‘The manuscript, markdown notes, and PDF are generated from the verified file set.‘ — needed for: Write the replication paper only from the checked local files and calculated outputs. — exists: n/a — status: workflow step ## Local files - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output/gvkey_clean_reproduction_dataset.csv‘ — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv‘ — needed for: Re-

cover the reported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv‘ — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

O Appendix O: Study Map Note

Study Map - research question: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer. - positioning: The replication matters because it targets a mechanism-heavy paper where the interaction structure, not only the sign of a main effect, is the core theoretical claim. - contribution: The paper's contribution is a near-structure-preserving reproduction that shows how the source mechanism survives in a fully local cleaned patent panel. - local design: The local rerun uses the clean GVKEY-anchored utility-patent panel already built in the workspace and keeps the patent-level interaction structure of the original paper. - estimand: A patent-level count model with interactions among breadth, organizational recombination experience, and organizational focus, plus firm and year controls. - headline estimate: '-0.0022' with 'p = 0.0076'. ## Decision Audit - Research question: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer. - Unit of analysis: Patent - Sample frame: Active S&P 500 utility patents with unambiguous GVKEY assignment in the local cleaned reproduction pipeline. - Time window: 1986 to 2016 in the local executable panel. - Outcome definition: Patent-level inventive impact measured from forward citations. - Main explanatory design: Patent-level count model with breadth, organizational experience, organizational focus, and their interactions. - Controls and fixed effects: Prior-art citations, recombination degree, field experience, scale, age, plus firm and application-year fixed effects; clustered inference when available. - Exclusion or substitution logic: The executable sample drops ambiguous firm-patent assignments and limits the panel to locally verified active S&P 500 utility patents. ## Source Versus Decision - direct source fact: The interaction structure is the theoretical core. - direct source fact: Forward citations measure impact. - direct source fact: The paper works at the patent level. local replication decision: The local rerun keeps the same interaction logic on the clean GVKEY-based panel. local replication decision: The local impact measure is the executable citation outcome already stored in the panel. local replication decision: The sample is narrowed to active S&P 500 utility patents with unambiguous assignment.

P Appendix P: Data Design Note

Data Design - Clean GVKEY-anchored S&P 500 utility-patent panel from the local replication pipeline. - PatentView-derived application year and citation outcomes. - CRSP-Compustat linked firm-year filters and sector information already present in the workspace. - panel file used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output - coefficient file used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_m - sample summary used: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv‘ - observations: ‘489,193‘ - entities: ‘200‘ ## Required Data And Local File Mapping - Source article: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf‘ — needed for: Recover theory, hypotheses, sample rules, definitions, tables, notes, and appendices — exists: Yes — status: Direct source - Analysis panel: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output/gvkey_clean_reproductio — needed for: Estimate the local model and regenerate descriptive statistics — exists: Yes — status: Executable local dataset - Coefficient export: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv‘ — needed for: Recover the reported local coefficients and p-values — exists: Yes — status: Executable local result file - Sample summary: ‘C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_sample_summary.csv‘ — needed for: Audit sample construction and raw grouped moments — exists: Yes — status: Executable local result file

Q Appendix Q: Derivations Note

Derivations And Estimands - The local rerun strongly preserves the negative breadth-by-experience interaction and the negative three-way interaction with organizational focus. - A patent-level count model with interactions among breadth, organizational recombination experience, and organizational focus, plus firm and year controls. - model equations are reproduced in ‘paper/main.tex‘. ## Variable Map - Inventive impact -¿ ‘inventive_impact‘ : Use the local cleaned citation outcome already stored in the regression dataset. - Breadth -¿ ‘breadth_c‘ : Carry forward the centered breadth variable from the local regression output. - Organizational experience -¿ ‘org_recomb_exp_log_c‘ : Carry forward the centered log experience variable from the same panel. - Organizational focus -¿ ‘org_focus_c‘ : Use the contemporaneous focus measure already reconstructed in the local pipeline. - Controls -¿ ‘n_prior_art_cites; recomb_degree; field_recomb_exp_log; total_patents_same_year; firm_age‘ : Reuse the local patent-level controls and fixed effects. ## Claim Evidence Audit - Direct source fact: The source paper studies: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer. — evidence: Project 1_ Ghosh et al. 2014 replication/Ghosh-Martin-Pennings-Wezel-OS-25-(2)-2014.pdf - Local calculated fact: The local executable panel contains 489,193 observations across 200 entities. — evidence: Data_Analysis/code/Regression/output/gvkey_clean_reproduction_dataset.csv — patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghos - Local calculated fact: The local headline estimate is -0.0022 for breadth x org_recomb_exp_log with p = 0.0076. — evidence: patent literature/daily_replications/2026-04-04/ghosh-martin-pennings-wezel-2014-ambition-focus/results/ghosh_2014_model_coefficients.csv - Replication decision: The manuscript uses local substitutions or analogues wherever the original data architecture is not fully recoverable. — evidence: Source-vs-decision table and limitations section

R Appendix R: Replication Decisions Note

Replication Decisions - The local clean sample is paper-comparable rather than guaranteed identical to the archival source frame. - Patent-firm matching and sample filters follow the executable local pipeline. - Interpretation should emphasize mechanism recovery more than exact coefficient duplication. - direct source facts are separated from local replication decisions in the manuscript. - no coefficient or table is fabricated. ## Source Facts Versus Local Decisions - source: The interaction structure is the theoretical core. - source: Forward citations measure impact. - source: The paper works at the patent level. decision: The local rerun keeps the same interaction logic on the clean GVKEY-based panel. decision: The local impact measure is the executable citation outcome already stored in the panel. decision: The sample is narrowed to active S&P 500 utility patents with unambiguous assignment.

S Appendix S: Local Execution Status Note

Local Execution Status - batch date: ‘2026-04-04‘ - status: long-form journal-style manuscript generated from local result files - current paper: ‘ghosh-martin-pennings-wezel-2014-ambition-focus‘

T Appendix T: Cleaned Output Tables Note

Cleaned Output Tables - paper-first reading protocol - required-data and file-manifest table - decision register - sample reconstruction table - local source inventory table - source facts versus replication decisions table - claim-evidence audit table - variable mapping table - key coefficient table - full coefficient table - descriptive statistics - correlation matrix - yearly audit - missingness audit - top-entity coverage table - quantile summary

U Appendix U: Build Notes

Build Notes

- batch date: ‘2026-04-04‘ - manuscript style: long-form journal-style replication draft - evidence rule: only processed local datasets and actual local estimates are used - workflow rule: read the source paper first, then map required datasets to verified local files, then write the paper from those files - skill path guiding the structure: ‘C:/Users/bai/.codex/skills/write-replication-journal-github/SKILL.md‘

V Appendix V: Manuscript Metadata

Field	Value
Paper	Ghosh, Martin, Pennings, and Wezel (2014)
Source title	Ambition Is Nothing Without Focus: Compensating for Negative Transfer of Experience in R&D
Authors	Anindya Ghosh, Xavier Martin, Johannes M. Pennings, and Filippo Carlo Wezel
Outlet	Organization Science
Batch date	2026-04-04
Rows	489,193
Entities	200
Headline term	breadth x org_recomb_exp_log
Headline estimate	-0.0022
Headline p-value	0.0076
Panel path	C:/Users/bai/OneDrive - Tilburg University/Desktop/replicate Ambions/Data_Analysis/code/Regression/output/gvkey_clean_reproduction_dataset.cs

W Appendix W: Replication Summary Note

Research question: The source paper asks whether broad recombination becomes less productive when it leans on familiar routines, unless organizational focus offsets that negative transfer. Local design: The local rerun uses the clean GVKEY-anchored utility-patent panel already built in the workspace and keeps the patent-level interaction structure of the original paper. Estimand: A patent-level count model with interactions among breadth, organizational recombination experience, and organizational focus, plus firm and year controls. Local result focus: The local rerun strongly preserves the negative breadth-by-experience interaction and the negative three-way interaction with organizational focus. Comparison note: This is the strongest executable match in the current batch. The negative breadth-by-experience interaction survives clearly, and the three-way interaction with focus remains negative and statistically meaningful, which means the central mechanism of the source paper is recovered in the local panel.
